

Artificial-Intelligence in Streamed Music Audit/Policy Research Proposal

Authors: Demetrius Davis, Anna Le, Alicia Yoon

Brown University

March 13, 2026

I. Introduction

Music has continuously been a field of evolving tactics and methods. Within the past years it has evolved and introduced Artificial Intelligence (AI) into its practices. As AI-generated music becomes a symptom of reality, users of streaming services aren't at liberty to determine their level of autonomy on every service. Within recommendation software AI-generated songs may be featured in a queue and amongst most is not something flagged by the service or controlled by the user.

Music streaming services like Spotify, Pandora, Apple Music, YouTube Music, Amazon Music and many others, have had different routes to these novel musical tactics. While Apple Music is introducing AI tagging there is no way to filter out the AI tagged music, and while Spotify has an option to block artists, there is no way to filter out AI-generated music.

II. Background and Related Work

AI-generated music and artists have become increasingly popular. Using information from platforms like Suno AI—which can create a voice over lyrics—and LANDR—which has been used by many mainstream artists to generate beats and lyrics—there is an understanding regarding its widespread usage. However, there is also an understanding about labeling and filtration, as some artists mentioned under LANDR's users consist of Lady Gaga, Snoop Dogg, and other notable names. Meanwhile, Suno AI has music creators like Xania Monet, Spalxema, and other creators whose voices are generated.

III. Research Questions

A. What are the parameters currently present or proposed within streaming services in regards to promoting transparency of AI generated music?

1. We will be evaluating what streaming platforms provide as ways for users to know what they are listening to but mainly for users to have autonomy over the content they receive.

B. Does the increased usage of AI-generation in music warrant legal regulation?

1. We will be reviewing the copyright and IP-laws regarding this topic to also inquire as to what are the set-in-stone boundaries. Have these streaming platforms been complicit with them? Or have they been standing in a fine gray area?

IV. Methods

Our methods consist of auditing and evaluating, by taking a list of 15-20 artists who are either fully AI generated or have been said to use AI generation in their content to see the various ways AI is being incorporated into the music production process. From this we can evaluate how music platforms inform users of its presence. Then we will evaluate labeling as well as ability to filter out these mediums of music creation as a way to provide listeners with agency. In this we will compare the streaming platforms with their competitors while also weighing the legality of filtration and other possible legal nuances.

V. Outcomes and Milestones

For our proposed outcome we will have a recommendation to include into the music streaming platforms to allow autonomy and transparency. This will be paired with a legal

proposal of how to mandate and ensure that this is a blanket clause rather than an individual option.

VI. Timeline

A. Key Steps

1. Generating a list of AI-generated music creators as well as singers who have used AI to create a large part of the song.
2. Evaluating the features prevalent on the streaming services that can identify and potentially filter.
3. Create an intersystem recommendation
4. Create a legal recommendation.
5. Finalize the presentation & paper.

B. Completion dates

1. March 31, 2026 - have list of artists finalized
2. April 7, 2026 - project milestone: have interface element ideas roughly finalized then shift focus to the legal side post progress check-in
3. April 15, 2026 - have legal recommendations finalized
4. April 19, 2026 - finalize slides/presentation
5. April 29, 2026 - finalize deliverable
